The American Council on Education, founded in 1918, is a *council* of educational organizations and institutions. Its purpose is to advance education and educational methods through comprehensive voluntary and cooperative action on the part of American educational associations, organizations, and institutions.

The Council's Office of Research was established in 1965 to assume responsibility for conducting research on questions of general concern to higher education. *ACE Research Reports* are designed to expedite communication of the Office's research findings to a limited number of educational researchers and other interested persons.

## Foreword

Development of the American Council on Education's annual National Norms is a truly collaborative effort. Each of the authors of this report assumed responsibility for one key aspect of the total effort. John A. Creager had primary responsibility for drafting the report, although all four of us shared in the editing and rewriting. Programming was also shared by three of us: John A. Creager was responsible for producing appropriate weights based on the sampling of institutions for 1968, Alexander W. Astin programmed the internal logic for creating the normative data and data for individual institutions, and Robert F. Boruch programmed the output routines for producing the institutional reports. The task of designing the reports was shared by Robert F. Boruch and Alexander W. Astin, and preparation of copy for the tables of normative data was handled by Alan E. Bayer.

The successful completion of a project of this magnitude and complexity required the combined talents of many other persons. In the Office of Research at the American Council on Education, we are especially indebted to Gerald T. Richardson, who assisted in the design and implementation of the data-editing software system; to Catherine White and Janet R. Liechty, who were responsible for quality control in the distribution and receipt of questionnaires; to Barbara Blandford, who handled our liaison with the participating institutions; to Helen Frazier, who aided in the preparation of various population and sample control decks, and to Penny Edgert and Charles Sell, who assisted in debugging the entire system. We also appreciate the expert assistance of Gerald F. Koch of National Computer Systems in Minneapolis, who supervised the document-to-tape processing phase of the project. Finally, we should like to express our gratitude and thanks to the presidents, representatives, and students of the cooperating institutions. Without their interest and support this project would not have been possible.

## National Norms for Entering College Freshmen: Fall 1968

The purpose of this report is to present national normative data on the characteristics of students entering colleges as first-time, full-time freshmen in 1968. These data are reported separately for men and women, for several types of institutions, and for different geographic regions of the country.

The data for this report (which is the third in an annual series) were compiled as part of the Cooperative Institutional Research Program being conducted by the Office of Research of the American Council on Education (Astin, Panos, and Creager, 1966, 1967a). The purposes of this longitudinal research program are to assess the impact of different types of college environments on students' development and to provide a source of current, readily available information about the population of American college students. The repetition of certain items of data and a large overlap in participating institutions from one year to the next provides a basis for judging trends in the characteristics of entering freshmen over time. The previously published reports of characteristics of freshmen entering college in 1966 (Astin, Panos, and Creager, 1967b, 1967c), and in 1967 (Panos, Astin and Creager), have elicited wide response, confirming the value of this information for those engaged in guidance, counseling, administration, educational research and manpower studies.

Although a total of 301,448 entering freshmen students at 435 colleges and universities participated in the 1968 survey, the normative data presented in this report are based on 243,156 freshmen entering 358 institutions. This difference between the total participation sample and the normative sample results from imposing certain quality controls and other technical and logistic requirements on the normative sample.

The normative data were collected by administering the Student Information Form to freshmen entering college during the fall registration or campus orientation period--before the student had started classes, but after he had matriculated. This survey instrument is designed to elicit a

wide range of biographic and demographic data, and expressions of career plans, student behaviors, and attitudes. The resulting data have been differentially weighted in order to be representative of the population of entering freshman students, and so that related summary data will be representative of the defined population of institutions. The information provided by these students, in conjunction with follow-up data to be collected from them in subsequent years, will be used to measure changes in their educational and career plans, attitudes, and behavior during the college years.

#### Sampling Design and Weighting Procedures

The primary sampling unit in the program is the institution. The defined population consists of all "eligible" institutions of higher education listed by the U.S. Office of Education in its annual Education Directory. An institution was considered "eligible" if it was functioning at the time of the survey and had the equivalent of a first-time entering freshman class of at least 30 students. Thus, institutions that require undergraduate credits for admission to their "first" class (for example certain professional schools) and some very small institutions (whose growth may qualify them as part of the defined population in subsequent years of the program) are excluded. The defined population includes all other accredited and nonaccredited institutions of higher education listed by the U.S. Office of Education--universities, four-year colleges, and two-year colleges (USOE, 1967). The eligible population at the time of the 1968 survey consisted of 2,303 institutions of higher education.

In the 1966 and 1967 surveys, the working sample of institutions was selected by first sorting the eligible population into 29 mutually exclusive stratification cells on the basis of several institutional characteristics. Several considerations have led to a restratification of the institutional population for the 1968 survey. In addition to the differential growth of this population, more recent and more relevant information has become available about most of the individual institutions. Experience

obtained during the first two surveys suggested that improved control of sampling errors could be achieved in some of the norms groups by introducing a more refined breakdown of the four-year institutions in the sampling design. The resulting restratification sorts the institutions into 35 cells with a shift in the major basis of stratification from a measure of affluence to one of selectivity.<sup>1</sup> The new stratification scheme is presented in Figure 1. Technical and logistic considerations leading to use of a complex, mixed-strategy design have been previously reported for the earlier surveys; the details of the restratification, and documentation of issues involved in sampling design for surveys of this type are being published separately (Creager, 1968).

The first major stratum of the earlier sampling design--consisting of the subpopulations of universities, four-year colleges, and two-year colleges--has been retained in the new design. This stratum not only represents an important functional difference among institutions, but also exerts some control over size and over the characteristics that define the norm groups. One change made for this survey is that the predominantly Negro institutions were separated from these subpopulations to form an additional, relatively small subpopulation, in order to ensure better representation of this especially interesting group of institutions. The predominantly Negro institutions are relatively homogeneous on selectivity and affluence, so that only two cells, defined on the public-private dichotomy, were formed.

---

<sup>1</sup>Affluence is defined as the per student expenditures for educational and general purposes. The measure is usually available for accredited institutions. Since more recent data are now available for both budgets and enrollments (Gleazer, 1968), revised values were computed for the 1968 Survey sampling procedures. Selectivity scores for each institution are the median standard scores on the National Merit Scholarship Qualifying Test taken by those high school juniors in the spring of 1966 who gave the institution as their first college choice (Nichols, 1966). An adjustment was made in computing the medians for institutions where the entering enrollments are less than the number of students choosing the college. Both the raw and normalized selectivity scores correlate .91 with the mean SAT verbal plus mathematical scores of students actually enrolled by 200 College Board schools in the fall of 1966 (CEEB, 1967).

The universities and two-year colleges were further stratified on selectivity scores wherever available. Since recent data required to compute affluence scores have become available for many of the accredited junior colleges (Gleazer, 1968), those without selectivity scores were stratified on affluence wherever possible. Before stratifying the four-year colleges on selectivity, this subpopulation was further subdivided into Public, Private-nonsectarian, Roman Catholic, and All Other Sectarian (mostly Protestant affiliated). The large number of four-year colleges permits this additional level of stratification in terms of control variables which also define some of the norms groups. Because separate weighting procedures are used within each sampling cell for computing norms by sex of the student, no sampling control of institutions is made for the sex ratio of the student bodies.

All 359 institutions that participated in the 1967 survey of entering freshmen were invited to participate in the 1968 survey. Of these, a total of 347 (97%) accepted once again. In order to ensure an adequate working sample in the more comprehensive stratified and growing institutional population, an additional 105 institutions were invited to participate.<sup>2</sup> In the spring of 1968, an invitation to participate in the 1968 survey was sent to the president of each of the 464 institutions. Affirmative replies were received from 434 of these institutions (93.5%). Of the 31 institutions that were unable to participate, only four failed to respond either to the original invitation or to the follow-up letters. Because of unforeseen administrative problems, 14 institutions that had agreed to participate were unable to return completed forms in time to be processed for inclusion in the national norms. Thus, data were obtained from a total of 419 (90%) institutions in the fall 1968 survey, including 339 (94%) of the institutions that participated in the 1967 survey and 286 (94%) of the 305 institutions

---

<sup>2</sup>Twenty-two of institutions were included either because they requested it, or because they were known to have educational programs of special interest to the research staff. In the past surveys, data from these institutions have been excluded from the normative sample. In the 1968 survey, such data are included if they meet all other quality control requirements. The sampling weights are adjusted to retain the overall representativeness of the sample.

that participated in both the 1966 and 1967 surveys.<sup>3</sup>

In our judgment, the procedures used by several institutions in administering the questionnaire were such as to produce a sample of respondents that was not representative of the entire entering freshmen class. A few institutions, for example, distributed the questionnaires to entering students with instructions to return them at some later date. After careful consideration of the methods used at each institution, we decided to base the national norms on data provided by only 358 of the institutions.<sup>4</sup>

Because of the disproportionate sampling from the 35 stratification cells, the data obtained from students enrolling at institutions in the various cells are differentially weighted. In addition, the data are further adjusted to correct for nonparticipation of students within colleges.

Table 1 (page 12) gives information about the participating institutions included in the 1968 national norms. The table contains the number in each stratification cell, and the cell weights applied to each institution's data in computing the national norms. The cell weights, listed in the last two columns of Table 1, were defined as the ratios between the number of first-time, full-time students entering all institutions in the eligible population within a given cell, and the total number of first-time freshmen entering ACE sample colleges included in the national norms within that cell. These cell weights were further adjusted according to the proportion of the institution's first-time full-time entering freshmen who completed the questionnaire and who reported their sex on the form.

---

<sup>3</sup> The total number of different participating "institutions" was really 435 instead of 419, since one of the state universities in our sample, which was considered to be one institution for purposes of determining the rate of repeated participation from 1967 to 1968, actually became 16 different "institutions" in 1968 because of a change in classification by the U.S. Office of Education.

<sup>4</sup> Although complete tabulations of their data have been provided to all participating institutions, those institutions whose data were considered not representative have been informed that comparisons between their institutional data and the national norms should be made with caution. In this regard, we deliberately chose to err on the conservative side; whenever the information we were able to obtain was not sufficient to determine that the data were representative, we excluded the institution from the national norms.

Except for a few institutions that selected representative samples of their entering classes, this second weight was typically near 1.0. The final weight that was applied to each student's data was the product of this within-institution participation weight and the appropriate cell weight shown in Table 1.<sup>5</sup>

On the basis of the weighting procedure, the summary data presented in this report represent national norms for first-time, full-time students entering institutions of higher education in the fall of 1968. It is important to note that the data presented here reflect the response of entering freshmen prior to experience with college life.

#### The Student Information Form

The Student Information Form is designed to serve two functions: first, to obtain standard descriptive and normative data for informational purposes; and, second, to obtain student input data for longitudinal research. The form, therefore, contains biographic and demographic items that have been administered annually to each entering class and research-oriented items which are either new, or which are modifications of items used in previous years. This decision permits coverage of the widest possible range of student characteristics, and also represents a compromise between two objectives: comparability of information from year to year and flexibility in research strategy.

In order that the reader may examine the survey instrument for its precise content and form, a copy is shown in Appendix 1 (pages 61-64). The form is designed for self-administration under proctored conditions and for processing (to magnetic tape) by means of an optical mark reader. The

---

<sup>5</sup> Note that the cell weight shown in Table 1 is a constant for each ACE sample institution in a given cell, whereas the within-institution weight is a constant for a given college but varies from one institution to another depending on how adequately the particular institution "covered" its entering class. A fourth type of weight (not shown) is the "institutional weight." This weight, defined as the ratio between the number of institutions in the population within a given cell and the number of participating institutions whose data were used in computing the 1968 national norms, will be utilized in studies where the institution (rather than the student) is the unit of analysis.

initial questionnaire and its subsequent modifications have been developed in close collaboration with representatives of professional associations, the participating institutions, governmental agencies, leading educational researchers, and administrators. Feedback of information from these sources and from the student responses to earlier questionnaires have been helpful in designing the present form. The items in the 1968 Student Information Form which were also used in the 1966 and 1967 surveys are summarized in Table 2. Although many of the items have been repeated from the 1966 and 1967 surveys, some are new, thus fulfilling both the requirements of flexibility of content and comparability of results from one survey to the next. Several items (e.g., probable major field of study) have been recoded into a smaller number of categories in the data presented here. Because such coding schemes cannot satisfy all needs, the original questionnaire responses and the recoding scheme used to report the data are shown in Appendix 2 (pages 67-70).

#### 1968 National Norms

Table 3 shows the numbers of institutions and of students on which the 1968 national norms are based, and an estimate (based on the weighting procedure) of the total student population.<sup>6</sup> The 358 institutions included in the national norms are divided into two-year colleges, four-year colleges, and universities; and then further divided into nine other categories (two-year public colleges, two-year private colleges, technological institutions, four-year public colleges, four-year private nonsectarian colleges, four-year

---

<sup>6</sup>It should be noted that these "head counts" of students entering different types of colleges are based on reports of total first-time, full-time students in 1968 given by each of our institutional representatives. These reports were then weighted in terms of the procedure described earlier. Since these weights are based on data from the 1967 institutional population (because of the time lag in obtaining USOE data), we have implicitly assumed that the total number of students entering our sample of institutions represents the same proportion of the total population within each sampling cell in 1968 as it did in 1967.

Protestant colleges, four-year Roman Catholic colleges, public universities, and private universities). The first category shown in Table 3 includes all institutions. In addition to these 13 normative categories, norms are presented for 11 "supplementary" categories: four geographic regions, six sectarian categories by sex and control, and predominantly Negro institutions.

The items of normative data (pages 19-58) appear in the same order used in the individual reports furnished to each participating institution. (A copy of an actual institutional report is shown in Appendix 3.) The first twenty-four pages report item data separately for men, women, and all students according to the first 13 categories shown in Table 3. The following eight pages show regional norms for men, women, and all students; the last eight pages of normative data are similarly arranged for the remaining seven categories of institutions listed in Table 3.

The different types of institutions can be compared on any given item by examining the percentages in the row next to the item. Although for many of the items the data differ substantially among categories of institutions, it should be remembered that on most of the items reported here there is considerable variation within any category of institutions.

A list of the colleges that participated in the American Council on Education's Cooperative Institutional Research Program fall 1968 survey is shown in Appendix 4 (pages 83-92).

#### Accuracy of the Normative Data and Their Comparisons

While it is impractical to report statistical indicators of the accuracy of every reported categorical percentage in every norms group, even if this could be estimated for the complex sampling design, it is useful to have some idea of the confidence that may be placed in the reported data. Such considerations are also important in comparisons of data across norms groups, related item categories, or survey years. A report of revised national norms for freshmen entering college in 1966 and 1967, based on the restratification design, is currently being prepared by the American Council

on Education for publication in 1969. These revised norms will be more nearly comparable to the 1968 freshman norms reported here. It is anticipated that the norms for the three survey years will be presented in a form exhibiting trends on items common to the survey years. Within the error limits discussed below, all three of these comparisons can be made from the published normative data in this series. Reported categorical percentages may be multiplied by the total number of students estimated for a norms group to convert the data into frequencies; such a procedure would be useful in estimating facility requirements in program planning. Where this is done, some caution in interpreting the resulting estimates may be prudent, since both the reported percentages and the estimated number of students in a total group are subject to sampling errors.

So far as random sampling errors are concerned, the standard error of a categorical percentage for the total normative sample is about 0.1%, being somewhat larger in the norms groups based on various subpopulations of the domain. For the smallest norm groups, the standard error may be as large as 2% in the first two surveys, but probably less than this with the restratification introduced for the 1968 survey. Because the sampling design introduces no explicit control for regional differences among institutions, somewhat less confidence can be placed in the regional norms.

The chief source of error in stratified sampling is the possible failure to obtain truly random samples within each stratification cell. Although reasonable precautions are taken to minimize known sources of non-random bias, the reported data are subject to some degree of constant and non-random variable errors. Although the extent of this is unknown, experience to date shows a consistency of patterns of differences in categorical percentages and of distributions defined by ordered categories, and general agreement of our data with other published data, where comparable. In spite of the fact that one might expect a few implausible results when reporting thousands of categorical percentages, we have found only a few inconsistencies and these could be regarded as within two standard errors under random sampling. The actual magnitude of such errors is unlikely to result in adverse decision-making in higher education. Some caution is necessary when a participating

institution compares its own summary data with the corresponding national norm group. This is especially true for the smaller institutions and for those not testing all of their entering freshmen.

In spite of these potential hazards, the national norms published in this series have proven to be highly useful and are believed to be sufficiently accurate to be used with confidence in practical matters of concern to higher education.

\*\*\* The 1968 definition of Nonsectarian Colleges for Men excludes all technological institutions. This is consistent with the definition employed in the 1966 Norms. However, five technological institutions were included in the definition of Nonsectarian Colleges for Men in the 1967 Norms.

NOTE:

The information in this report is being collected for the American Council on Education as part of a continuing study of higher education. Your cooperation in this research will contribute to an understanding of how students are affected by their college experiences. Identifying information has been requested by the Council in order to make subsequent mail follow-up studies possible. Your responses will be held in the strictest professional confidence, and will be used only in group summaries for research purposes.
