The Cooperative Institutional Research Program (CIRP) is a national longitudinal study of the American higher educational system. Established in 1966 by the American Council on Education, the CIRP is now the largest ongoing empirical study of American higher education—involving data on more than 600 institutions, 100,000 faculty, and 3.0 million students. In order to maximize the utilization of these data in research and research training, responsibility for administering the CIRP was transferred in 1973 to the Graduate School of Education at the University of California, Los Angeles. The annual CIRP survey of entering freshmen is now administered from the Higher Education Laboratory at UCLA under continuing support and sponsorship of the American Council on Education.

AMERICAN COUNCIL ON EDUCATION

The American Council on Education, founded in 1918, is a council of educational organizations and institutions. Its purpose is to advance education and educational methods through comprehensive voluntary and cooperative action on the part of American educational associations, organizations, and institutions.

The American Freshman:
National Norms for Fall 1975

This is the tenth annual report of national normative data on characteristics of students entering college as first-time, full-time freshmen. This series, which was initiated in 1966, is a part of the Cooperative Institutional Research Program (CIRP), an ongoing longitudinal study of the American higher education system.

The principal purpose of the CIRP is to determine the effects of college on students (Astin, et al., 1966). During the past eight years, normative, substantive, and methodological research has produced information pertinent to a wide range of issues in higher education (Astin, 1974).

The freshman survey data reported here have been weighted to provide a normative picture of the college freshman population for persons engaged in policy analysis, manpower planning, administration, educational research, guidance and counseling, as well as for the general community of students and parents. The survey instrument, the Student Information Form (SIF), is revised annually to reflect the changing concerns of the academic community and of others who use the information. SIF data also provide initial input information for longitudinal research. Followup surveys of individual students in each entering class are conducted at various intervals after the initial survey.¹ In the past year, longitudinal followups of CIRP students have been used in major studies of dropouts (Astin, 1975) and campus protests (Astin, Astin, Bayer and Bisconti, 1975).

From 1966 to 1970, approximately 15 percent of the nation's institutions of higher education were selected by sampling procedures and invited

¹ Normative results from followup studies have been published as have descriptive profiles for student subgroups abstracted from the freshman survey information.

to participate in the program. As the academic community became aware of the value of program participation, additional institutions asked to participate. Beginning in 1971, all institutions that have entering freshman classes and that respond to the U. S. Office of Education's Higher Education General Information Surveys were invited to participate. A minimum charge, plus a unit rate based on the number of forms processed, helps to defray the direct costs of the survey. Beginning in Fall 1974, samples of proprietary institutions also participated in the survey. Data from these institutions will be published in separate reports.

The normative data are reported separately for women and for men, and for 38 different groupings of institutions. The major stratifying factors are institutional race (predominantly black versus predominantly white), type (two-year college, four-year college, university), control (public, private-nonsectarian, Roman Catholic, and Protestant), and the "selectivity level" of the institution. Selectivity, which is an estimate of the average academic ability of the entering class, was made an integral part of the CIRP stratification design (see Figure A) in 1968 because of its substantial correlation with most measures of institutional "quality" (Astin, 1962). For the 1975 norms a revised and updated selectivity measure was used (see below.)

The 1975 Data

Although 314,069 entering freshmen at 562 colleges and universities returned their forms in time for data to be included in the 1975 survey, the normative data presented here are based on responses from 186,406 freshmen entering 366 institutions; this institutional figure includes 339 prior and 27 new participants.

The national norms are based only on data from institutions where the coverage of entering freshmen was judged to be representative. This judgment

is based on the percentage of first-time freshmen who completed the 1975 SIF and on the procedures used to administer the forms. Four-year colleges are included in the national norms if over 85 percent of their first-time, full-time freshmen completed the SIF; universities must have over 75 percent participation, while two-year colleges must have 50 percent.²

The normative data presented here were collected by administering the 1975 SIF during registration, freshman orientation, or the first few weeks of classes. The SIF is designed to elicit a wide range of biographic and demographic data, as well as data on the student's high school background, career plans, educational aspirations, financial arrangements, high school activities, and current attitudes. Those data meeting minimal quality requirements for inclusion in the 1975 norms were differentially weighted to represent the population of entering freshmen at all higher educational institutions in the United States.³

Part-time students and those who are not first-time college students (i.e., transfers and former enrollees) were excluded from the normative sample. Beginning with the 1972 survey, special care has been taken to define these enrollment statuses; in surveys before 1972, the participating institutions were asked to exclude part-time students, while non-first-time students were excluded during the data processing stage by screening out

²Each participating institution received a complete tabulation of its data, but those with unrepresentative sampling were informed that comparisons between their institutional data and the national norms should be made with caution.

³A distinction should be made between higher education and postsecondary education. These surveys do not include students attending proprietary, special vocational, or semiprofessional institutions; they do include those attending two-year colleges with terminal occupational programs. However, in the fall of 1975 a sample of 50 proprietary institutions was included in the freshman survey under a contract with the Higher Education Research Institute, with support from the U. S. Office of Education. A normative report of data for these institutions will be published early in 1976.

those who indicated that they had previously attended college. Since that time, all students who did not identify themselves as part-time were included in the national norms, if they either graduated from high school in the year of the survey or had never attended any institution for credit.

The Higher Education Universe and Institutional Stratification Design

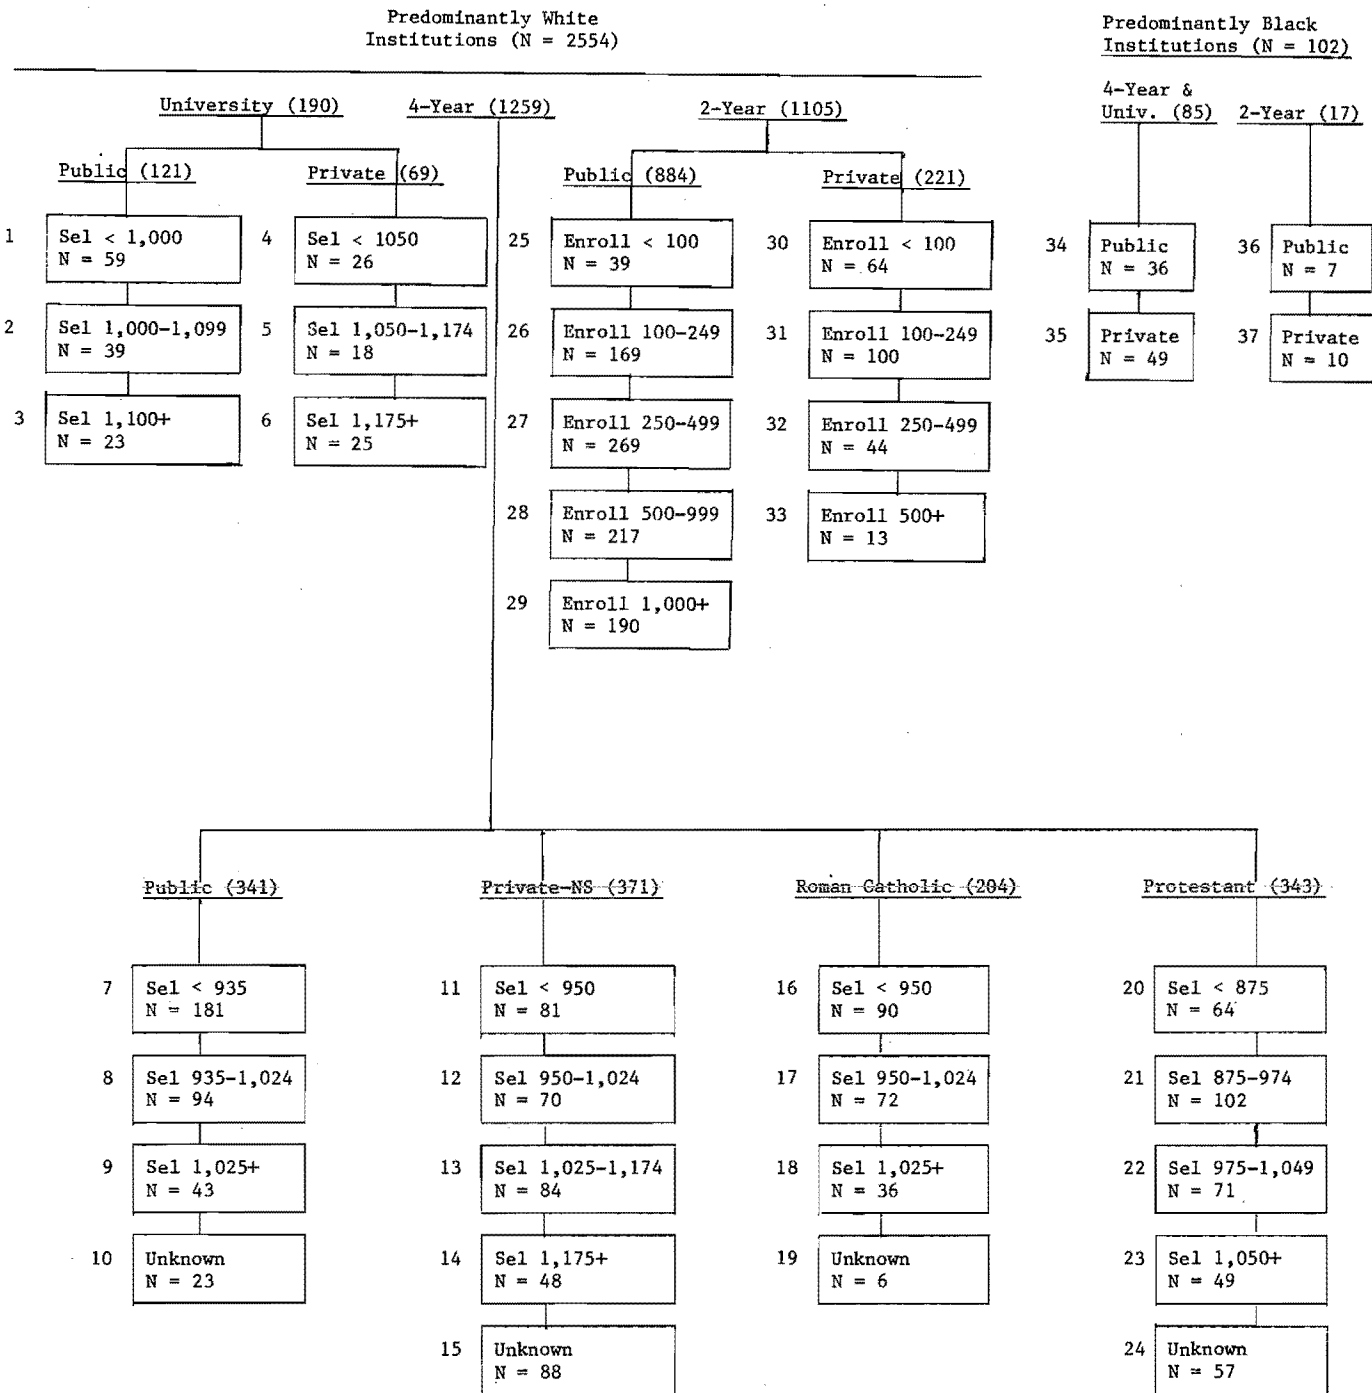

Except for the revised selectivity measures (see below), the stratification design for the 1975 survey is identical to that used in 1974 (see Figure A). The rationale for this particular design is provided in the 1971 normative report.

The population included all eligible institutions of higher education listed in the annual USOE Education Directory (1974). An institution was considered eligible if it was functioning at the time of the survey and if it had a freshman class of at least 30 students. Thus, institutions requiring undergraduate credits for admission to their first class (e.g., some professional schools) and a few very small institutions were excluded. In addition some institutions or their branches were included even though separate 1974 enrollments were not available from USOE, because they were part of prior universes in these surveys and were known to be functioning with first-time, full-time entering freshmen. With these exceptions, the defined population comprised all accredited and nonaccredited institutions listed by USOE, whether university, four-year college, or two-year colleges. For the 1975 survey, the population of institutions numbered 2,656.

Typically, institutions make budgetary decisions and plan their orientation and registration early in the year. Since these matters affect participation in the freshman survey, institutions must be invited to participate several months before information is available to define the final survey population. A total of 2,629 institutions were invited to participate

^aSelectivity (Sel), used to define strata for four-year colleges and universities, is an estimate of the mean for entering freshmen of the Verbal + Mathematical scores on the Scholastic Aptitude Test (or American College Test Composite converted to equivalent SAT V+M). The method of estimation is described in detail in Astin and Henson (1975) and on page 12 of the current report. Enrollment (Enroll), used to define strata for two-year colleges, is based on the total number of first-time, full-time entrants.

in the 1975 survey. Of these, 934 (35.5 percent) had participated in one or more of the earlier surveys, and 1,694 (64.5 percent) were new invitees. A total of 595 (22.6 percent) of the institutions accepted the invitation to participate. Of the 576 participating in the 1974 survey, 529 (91.8 percent) accepted again in 1975.

Because of administrative and logistic problems, 33 institutions that accepted the invitation to participate were unable to return the completed forms in time for their data to be included in the national norms. Thus, data were obtained from 562 (94.5 percent) of the institutions that had agreed to participate in the 1975 survey. Appendix A lists all institutions that have participated in the CIRP in any of the ten years since its inception and indicates for each institution the current stratification cell assignment, the number of years it has participated, and its status in all surveys.

Weighting Procedures

The data obtained from students were differentially weighted because of disproportionate sampling of institutions within each stratification cell and because not all students at each college completed the SIF. Table 1 shows the number of participating institutions in each stratification cell and the cell weights applied to each institution's data in computing the national norms. The cell weights in the last two columns are the ratios between the number of first-time, full-time freshmen in the eligible population within a given cell and the total number of freshmen entering sample institutions in that cell, computed separately for each sex. Since population data for 1975 enrollments were not available at the time of the 1975 survey, these weights were derived from 1974 data. In effect, this procedure assumes that the sample institutions within a cell account for the same proportion of

students in that cell in 1975 as in 1974.

These cell weights were further adjusted within each institution, by sex, according to the proportion of the institution's 1975 first-time, full-time freshmen who completed the SIF. These total counts of 1975 freshmen are obtained directly from each participating institution at the time of the freshman survey. Typically, this second weight was between 1.0 and 2.0; in the case of an institution that administered the form to its entire freshman class, the weight was exactly 1.0. The final weight applied to the data from each student was the product of this within-institution participation weight and the appropriate cell weight shown in Table 1.⁴

These weighting procedures generated summary data representative of all first-time, full-time students entering institutions of higher education in the fall of 1975. Note that the SIF was completed by entering freshmen and, thus, the data reflect responses prior to any substantial experience with college life.

The Student Information Form

The SIF is designed to serve two functions: first, to obtain student input data for longitudinal research; and second, to obtain standard descriptive and normative data for general information. The form thus contains standard biographic and demographic items that have been administered annually to each entering class, as well as research-oriented items that are either new (e.g., freshmen were asked for the first time in 1975 how well their secondary schools had prepared them in various subject matter areas) or modified from previous years (e.g., see the list of attitudinal questions

⁴Cell weight in Table 1 is a sex-specific constant for each sample institution in a given cell, whereas the within-institution weight is a sex-specific constant for a given institution but varies from one institution to another, depending on how adequately the institution "covered" its entering class.

listed under item #33). The inclusion of both new and modified items permits a more thorough coverage of student characteristics but also represents a compromise between two mutually exclusive objectives: (1) comparability of information from year to year which is required for assessing trends; and (2) flexibility in item content to meet changing informational and research needs. Table 2 lists the 1975 SIF items and indicates previous survey years in which comparable items have been used.

The SIF, reproduced in Appendix B, was developed in collaboration with students, professional associations, participating institutions, government agencies, educational researchers, administrators, policy makers, and members of the CIRP Advisory Committee (see inside front cover). It is designed for self-administration under proctored conditions and for processing onto magnetic tape with an optical mark reader. The 1976 SIF is currently being designed with the assistance of the Advisory Committee.

Each year, four tape files are developed from the SIF: (1) an institutional summary file containing institutional identification numbers and an institutional summary of the responses for men and women; (2) a file containing individual responses and a student identification number, but no names and addresses; (3) a name-and-address file containing a second, independent student identification number; and (2) a "link" file containing only the two independent identification numbers. This last file is maintained under an elaborate system developed to ensure strict confidentiality of individual student data and to protect against misuse of the name-and-address file (Astin and Boruch, 1970).

^bIncludes those with unknown selectivity.

weighting procedures, of the total student population. (These counts are the product of the 1975 enrollments reported to us by the institutions and the cell weights shown in Table 1.)

The creation of norms groups based on selectivity was accomplished as follows:

<u>Selectivity Level</u>	<u>Stratification Cells Assigned to Each Level</u>
low	1, 4, 7, 10, 11, 15, 16, 19, 20, 21, 24
medium	2, 5, 8, 12, 17, 22
high	3, 6, 9, 13, 18, 23
very high	14

New selectivity measures for the population (Astin and Henson, 1975) were used to restratify the CIRP population for the 1975 survey. These estimates are based on data provided in several published college guides and on data reported previously by Astin (1971). Most estimates were originally in the form of mean SAT Verbal (V) plus Mathematical (M) scores of entering freshmen. Mean ACT composite scores were converted into comparable mean SAT V+M scores (see Table 3-1 in Astin, 1971).

The dividing lines between the new levels are as follows:

<u>Dividing Line Between:</u>	<u>Universities</u>				<u>Four-Year Colleges</u>							
	<u>Public</u>		<u>Private</u>		<u>Public</u>		<u>Private</u>		<u>Catholic</u>		<u>Protestant</u>	
	<u>SAT</u>	<u>ACT</u>	<u>SAT</u>	<u>ACT</u>	<u>SAT</u>	<u>ACT</u>	<u>SAT</u>	<u>ACT</u>	<u>SAT</u>	<u>ACT</u>	<u>SAT</u>	<u>ACT</u>
low & medium	1,000	22.5	1,050	24	935	21	950	21.5	950	21.5	975	22
medium & high	1,100	25	1,175	27	1,025	23	1,025	23	1,025	23	1,050	24
high & very high	--		--		--		1,175	27	--		--	

These new selectivity measures are more current, more accurate (i.e., most were provided directly by the institutions), and involve less missing data (i.e., fewer with "unknown" selectivity). For details see Astin and Henson (1975).

The items of normative data appear in the same order in the norms report and in the individual reports furnished to each participating institution. The first 36 pages of the national norms present item data separately for men, women, and all students according to the first 15 categories in Table 3; the next two sets of 12 pages show norms for universities and four-year colleges, respectively, broken out by selectivity levels; the final 12 pages show norms for the four geographic regions.⁵ (Since these regions are not derived from the stratification design, regional comparisons should be made with caution.)

The different types of institutions can be compared on any given item by examining the percentages in the row following the item. For many items the data differ substantially among categories of institutions, as well as within any single category.

To report statistical indicators of precision for every categorical percentage in every norms group is impractical. However, some idea of the reliability of the reported data is important for comparisons across norms groups, across related item categories, and over time (i.e., with data from earlier norms reports). Appendix D presents some guidelines for judging the precision of the normative estimates and their comparisons.

⁵ A state is assigned to a given region by USOE criteria. See Appendix C for region categories. Also in Appendix C are the several items (e.g., probable major field of study) that have been recoded into a smaller number of categories for tabular purposes.

1975 National Norms

NOTE: Because the institutional population was restratified in 1975 using updated selectivity measures (Astin and Henson, 1975), the normative data reported herein may not be comparable to data for previously published freshman surveys. An updated reanalysis of data from the nine earlier surveys (1966-1974), utilizing the new stratification design, will be published in Spring 1976.

^aParticipation in the ACE/UCLA Cooperative Institutional Research Program for a given year is indicated by an "X." Institutions providing data judged to be representative of their first-time, full-time freshman class and included in the norms are indicated by an asterisk. Participation for 1975 is shown for those institutions which had submitted data in time to be included in this publication.

The Laboratory for Research on Higher Education at UCLA actively encourages the colleges that participate in this survey to conduct local studies of their student bodies. If these studies involve collecting follow-up data, it is necessary for the institution to know the students' ID numbers so that follow-up data can be linked with the data from this survey. If your college asks for a tape copy of the data and signs an agreement to use it only for research purposes, do we have your permission to include your ID number in such a tape? Yes No

Precision of the Normative Data and Their Comparisons

Precision of the Normative Data and Their Comparisons

So far as random errors are concerned, the standard error of a categorical percentage is a function of that percentage and of the number of participants (unweighted) in the norms group. Approximate standard errors for various item response percentages, by size of norms group, are presented in Table D-1. If one allows for finite sampling and stratification, values would be somewhat lower. Primarily, however, stratification ensures some sampling in all sectors of higher education and provides a basis in the weighting procedures for disproportionate sampling of institutions. In comparisons involving item response percentages for independent norms groups or for freshman cohorts, the standard error of the difference is approximately equal to the square root of the sum of the squared sampling errors.

A potentially important source of error in stratified sampling is the nonrepresentativeness of samples within each stratification cell. Although reasonable precautions are taken to minimize known sources of systematic bias, the data are subject to some unknown degree of constant and nonrandom variable errors. A participating institution must be cautious when it compares its own summary data with data for the corresponding national norms group, especially when the institution is small or when it has not surveyed all entering freshmen.

While comparisons of these 1975 data with earlier published national norms from the nine previous surveys of freshmen (1966-1974) are possible, it is recommended that such comparisons not be done until publication of a revised set of norms from these earlier years based on the new 1975 stratification scheme (probably March or April of 1976). Those wishing to make comparisons before the revised norms are available should keep in mind the

following considerations:

1. In addition to the revised selectivity measures introduced in 1975, major changes in the stratification and weighting procedures were introduced in 1968 (addition of cells for black colleges and selectivity levels) and 1971 (addition of cells for public and private universities, public and private black colleges, and size levels for two-year colleges).

2. Since certain items may not be comparable because of minor wording changes, the exact wording of items should first be examined.

3. While every effort has been made to maximize comparability of the institutional sample from year to year (repeat participation runs about 90 percent), comparability is reduced somewhat by (a) non-repeat participation and (b) variations from year to year in the quality of data collected by repeat participants.

4. Since the regional norms are not based on the CIRP stratification design (all of the other 34 norms groups are derived directly by collapsing selected stratification cells), regional comparisons (particularly of N's), should be made with caution.
